z2-Environment - Improvement #1746

Support materialization of Maven artifacts (component/module name escaping)

18.05.2014 21:24 - Henning Blohm

Status:	New		**Start date:**	18.05.2014
Priority:	Normal		**Due date:**

Category:	z2-core		**Estimated time:**	0.00 hour
Target version:	3.0			
origin:				

Description

When moving from experiment to solution, it would be desirable to have the ability to move artifact dependencies into another repository as classical Z2 modules.

However, the naming format for maven artifacts (notably the ":") does not translate well to Z2's file system layout, at least under Windows.

Suggestion:

- allow module name definition in a module-level z.properties
- translate ":" to path-separator
- treate ":" equivalent to "~" when running on Windows

History
